... Pure MIDI Drum Machine Beats Me is a pure MIDI based x0x-like drum machine that grows out of frustration with various soft drum machines. It is inspired by the Korg ES-1 and Fruity Loops, the Rebirth from AccessMixer2, the Roland TR-707 and a lot of other drum machines. It is programmed entirely with Studio Ableton

Live/Mac. It can operate without a mouse or MIDI keyboard. In fact you can also run the software without the need for any graphics card at all. + Download (210.1 MB)

Documentation If you cannot use the mouse, e.g. if you're sight impaired like I am, most software drum machines aren't any good. Few, if any, let you map the step keys on the keyboard directly, input rhythms in real time and all in all control all aspects of pattern and song playback without using the rodent. Even fewer soft beat boxes respect your Windows fonts, colors and use the standard controls, here again Beats Me is quite different. Beats Me's main goal is to be a fully

keyboard usable and screen reader accessible MIDI drum machine with a minimalist feature set. Mouse usage is supported as an after thought, which is quite the contrary of most music software. I've added the features I use myself and am sharing this drum machine in the hopes of it being useful for other people, too. The source is also available under GPL like terms (ask me for the details), though the GUI bits are messy and Windows specific. It has never been designed to be run as a drum machine. It was meant to be used as a drum machine development tool and the main goals of this tool are to make drum creation and editing as easy

as possible and to let you solve problems quickly. Sometimes, you want to try out your current drum pattern and it just isn't working out. Then, you need to know what it is doing wrong. Sometimes, you've made a drum pattern and you just aren't happy with it. So, you might want to chop it up, add some effects to it or move parts around. Sometimes, you might want to try something out. You might even make a whole song and just want to test something, say, to know what the power of a monophonic synth is. So, Beats Me is a very powerful development tool to help you solve all of these problems quickly

It's quite hard to describe what this app is about, so I'll try to explain what it isn't: This is not a soft piano-based beat box, nor does it require track selection or step control. The goal of the application is to provide a pure keyboard based drum machine. To play you set the length of the song (up to 64 bars long) and run the lead in the background. While it's running you mix songs, adjust volume, volume envelope, pan, or lock the view to the selected song. You can use your right hand keyboard to play the various drums, using the physical keys to the left of the drum pads as shown in the examples above. You can also assign any of the ten drum

keys to your other ten keys. The only requirement is that you have the same drum key on both hands in the same column, or on the right hand keys one and on the left hand keys the other. (E.g. K on A1 and K on A2.) You can also use the keyboard shortcuts listed below for pattern playing. Some are available in two or even three different versions on the Windows keys. The buttons on the bottom left control the sequence progress, looping, vibrato and stereo panning. And finally the support keys let you change the tempo, gain and pan. If you run the application as a background application, any changes you make are not saved.

This means that you need to run the application as a foreground application to save your changes. When a song is done you press the STOP button in the middle of the top screen. This will stop playback of the song and save all pattern settings. When you load a song, the first 16 bars will be pre-selected to serve as the basic drumming pattern. The rest of the song is played using the sequence of patterns. You can select the pre-selected patterns for playback using the buttons at the bottom of the screen. When you press the STOP button, the last song in the queue is stopped. If there is only one song in the queue, it will play

that song back to completion. However, if there are more than one song in the queue, pressing STOP will stop the last song. There is no recording function. I didn't want to depend on a third-party library like Audacity. The only sound playback comes from the internal audio playback processor. You can select your input sound with the aa67ecbc25

Fast, easy, fun, use your keyboard to play drums; uses a multiple step key sequence for the snare drum step(not like a FW analog drum machine, but something like a step sequencer like the Roland ES-1 or the Yamaha PW-15 or 88 style analog). Also works with an external sequencer that you feed as MIDI input. As a bonus, it has a built in reverb with parameters that are easy to read. Enjoy:

- 8 sample types (drums & percussion, claps, shaker & cymbal)
- 16 samples per type (4 versions)
- All 8 samples sequenced for variable speed playback
- Each sample is

customizable • 8 presets for starting you off (order may vary in play back) • Selectable notes in the high notes section: b & c (so you can play chords) • Adjustable timbre (3 types of sounds) • The timbre adjusted volume control is a bit crude but does go up to +8 so you can compensate for noisy MIDI cards • Adjustable unison setting controls the size of the click to make polyphonic playing of multiple samples easier • Adjustable kick/snare/tom/cymbal select toggles the snare to the kick, or kick to the snare, or cycle through the 4 (drums) • Small drum/vocals/percussion portamento control allows you to play a whole

chorus of a song in a semi auto way, simply hold your finger down on a note key until it plays • Fullscreen mode is activated by hitting the space bar, perfect for watching TV or web pages • Record mode is activated by hitting the stop button, you may not like the options in the settings • You may also record/load individual samples (e.g. kick/snare) and use those later (requires backups) • Record mode reverb is a nice touch to help hide your mistakes • No low-pass filter on the sound though so you may need to adjust the volume manually if your sound card produces extra noise • The kick is connected directly to the snare (no pedals),

but the snare is fed through a dedicated output so you can connect a footswitch to the kick if you like • I can never turn off the sampling (but you can on many other drum machines) • Sample start/end points are explicit, so you can mix in other samples (as opposed to many
